Individual Contribution – Nichelle

I independently completed the L02 deep learning lab using the provided VGG16 notebook in Google Colab. My contributions included reviewing the VGG16 architecture, running the preprocessing and prediction steps, and testing the pre-trained model with my own images.

I uploaded and tested images of my cats, Gigi and Henry, to observe how the model classified different inputs. Gigi was identified with cat-related labels such as `tiger_cat` and `tabby`, while Henry produced unexpected predictions including `printer`, `refrigerator`, and `dishwasher`. I used these results to analyze how image composition and visual features can influence a model's predictions.

I also added markdown documentation after Activities 2–5 to explain the objectives and summarize what I learned from each section. I completed the conclusion, self-assessment, and reflective journal based on my own observations and understanding of the lab.

My work focused on understanding the model architecture, preprocessing workflow, prediction process, and the sensitivity of deep learning models to differences in input data.
