Individual Contribution.

For this assignment, I completed the VGG16 deep learning lab individually. I loaded the pre-trained VGG16 model and reviewed its architecture. I also prepared and uploaded an image and used the model to make predictions.

I tested my dog image and recorded the prediction results. I also modified the image and compared the results before and after the changes. The model continued to identify the image as a Golden Retriever, but the confidence changed. During the lab, I also worked on fixing the errors I encountered. I had a problem downloading the first image and another problem with the `random_shift` function. I tested different solutions and checked the function arguments until I was able to run the code successfully.

My individual contribution was completing the lab activities, troubleshooting the code, and analyzing how the image changes affected the VGG16 predictions.
